

The cloth is placed on a tray in front of the machine and passes upwards over an inclined table, where by means of reciprocating knives stretching across the machine the cloth is carried backwards and forwards and folded in layers on a sinking table, convex in shape, to conform to the curve described by the moving knife.

The mechanism of the machine is of a simple character, consisting of a series of levers actuated by a cam driven from the driving shaft, and an apparatus is applied to stop the machine as soon as the end of the cloth passes over it.
